## Attachment 10

## SOURCES OF PM2.5

## COMPONENTS OF PM2.5,THEIR SOURCE AND FUTURE PROJECTIONS

The figure below shows a west to east traverse of 111 km . across London from Henly to Southend-on-Sea giving the Annual Mean PM2.5 concentration and the breakdown of components.
It shows a remarkably uniform "background" concentration between $10-12 \mathrm{ug} / \mathrm{m}^{\wedge} 3$ with little direct urban traffic contribution at either extremity. Towards central London, the mean concentration increases to between $14-16 \mathrm{ug} / \mathrm{m}^{\wedge} 3$, the increase mainly traffic related, suggesting a 30-40 \% contribution to the overall PM2.5 mean. The PM2.5 values for Village road, though scattered, suggest a "background" concentration of $8.3 \mathrm{ug} / \mathrm{m}^{\wedge} 3$ (corresponding to zero traffic flow) rising to $11.5 \mathrm{ug} / \mathrm{m}^{\wedge} 3$ for a traffic flow of 600 vehicles per hour, suggesting a similar traffic-related contribution of $30-40 \%$.

| non-traffic sources |
| urban dust |
| rural dust |
| secondary organic |
| secondary inorganic |
| residual |
| sea salt |

## CONTRIBUTIONS AND PROJECTIONS

The Table below taken from (1) shows the contributions to annual mean PM2.5 in the UK in 2009 and a projection to 2020 indicating a $15 \%$ reduction.

| Component | $\mathbf{2 0 0 9}$ | $\mathbf{2 0 2 0}$ |
| :--- | ---: | ---: |
|  | 0.67 | 0.67 |
| sea salt | 1 | 1 |
| residual | 4.05 | 3.34 |
| secondary inorganic aerosol | 0.86 | 0.86 |
| secondary organic aerosol | 1.14 | 0.8 |
| regional primary | 0.51 | 0.51 |
| rural dust | 0.62 | 0.62 |
| urban dust | 0.07 | 0.06 |
| point source | 1.02 | 0.78 |
| non-traffic area sources | 0.75 | 0.38 |
| traffic area sources | $\mathbf{1 0 . 6 9}$ | $\mathbf{9 . 0 2}$ |
| Total |  |  |
